HONEYWELL STRENGTH

For over half a century, Honeywell has been a key supplier to the worldwide electronics industry, providing critical materials to enhance the performance and reliability of our customers' products.

SOLVING INCREASING THERMAL CHALLENGES FOR TODAY AND TOMORROW

Our ongoing investment in research for more advanced materials has resulted in breakthroughs for key applications: thermal interface materials (TIMs) such as phase change materials, and low alpha particle materials for electrical interconnect.

The modern electronics industry is constantly advancing toward higher power consumption and more integrated

manuf ustry is the he

functions and miniaturization, resulting in a sharp increase in the power density of modern electronic devices. In fact, we have entered the era of 5G.

Therefore, efficient heat dissipation has become an even more critical requirement for the design of modern electronic packages. Thermal interface materials (TIMs) are widely employed to manufacture the most critical parts in the heat dissipation system, to cool and protect integrated circuit (IC) chips.

A FOUNDATION OF EXPERTISE

Honeywell's commitment to advanced materials research is evidenced by its three global centers for excellence in the US and China.

Whether adapted from our extensive portfolio of proven materials, or created for a specific customer, all Honeywell products undergo rigorous research, testing and quality control protocols.

Honeywell TIMs are based on proprietary technologies of polymer matrices and thermally conductive fillers, enabling them to handle challenging heat dissipation issues with long-term reliability and low cost of ownership

COUNT ON HONEYWELL

- 50+ years providing materials for electronic products.
- More than 1,000 employees across the United States, Europe and Asia.
- 3 major R&D centers located in California, Washington and
- Continuous investment in research and development.
- Worldwide strategic collaborations.
- Approximately 400 granted and pending patents

TARGETED MATERIALS

Smartphones and tablets experience sudden temperature spikes, requiring very high thermal performance, while power electronics in automobiles need extreme thermal stability to meet warranties that stretch over long lifetimes. Our TIMs portfolio is designed to meet these varying needs and more.

OUR APPROACH

We have designed our products to optimize thermal impedance. This means that we look at the entire thermal path, not just the TIM itself. This includes the material interfaces, the thermal expansion of the joining interfaces, contact resistance and bond line thicknesses.

Our portfolio of materials dissipate heat away from the IC, in an appropriate way for the device structure, packaging design and application. The design of Honeywell's phase change materials (PCMs) is driven by an innovative polymer technology and advanced filler systems, which can be customized to fit diverse product applications and end uses.

In addition to our phase change materials, we offer a variety of products with high thermal conductivity and high compressibility, including thermal gap pads, Thermal Hybrid, thermal grease, thermal insulators, and more.

Honeywell's application support experts can help you choose the correct thermal interface solutions for your product — taking into account its design, usage and life cycle.

DETERMINING YOUR TIM REQUIREMENTS

The role of Thermal Interface Materials is to dissipate heat as quickly and effectively as possible from the device. But not all devices are the same. Requirements are driven by product use, product life cycle, packaging design, and operating conditions.

Thermal Performance

Increasing power densities are raising device temperatures — requiring more effective TIM solutions that must deliver low thermal impedance and high bulk conductivity. Reducing operating temperature can reduce device throttling, while increasing efficiency and design flexibility.

Product Life Cycle & Reliability

Mobile products such as tablets and smartphones have a relatively short product life, but still require thermal management to protect from extreme and sudden bursts of energy and temperature spikes.

Conversely, automotive, power and server products must remain robust for significantly longer product life cycles. These applications involve harsh operating conditions such as extreme heat and humidity, which must be taken into account in choosing the best TIM material. The key requirement in these applications is not just immediate performance but also sustained, long-term thermal stability.

Gaps & Bondline Thickness

IC designers are continually looking for ways to achieve more processing power in less space. Additionally, high power devices with dedicated heat sinks aim to achieve an extremely thin TIM bond line with low thermal impedance and a reduced thermal path. To add to the complexity, chip-scale packages assembled on a PC board will share the same heat spreader but will have different heights with varying gaps, requiring a TIM that delivers both thermal and compressible properties.

Taking all this into consideration, it is important for today's TIMs to provide effective thermal management in increasingly constrained environments and different assembly designs.

center in Shanghai, China.

THERMAL PHASE CHANGE MATERIALS

Phase change materials (PCM) are often used as matrix materials for thermal interface applications, because they are solid at room temperature, and soften when heated. They can fully fill the gaps of contact surfaces, therefore providing a thin bondline and high reliability without pump-out issues.

TYPICAL APPLICATIONS

- Power control unit, inverter, onboard electronics
- IGBT
- Servers, supercomputing, video graphic array (VGA) cards, AI, GPU/CPU/Desktop, solid state drives (SSD)
- Switches, routers, base stations
- Tablets, gaming, notebooks, smartphones, action cameras
- Lighting

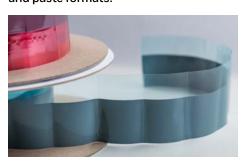

THERMALLY CONDUCTIVE PHASE CHANGE MATERIAL

For many applications, the Honeywell solution, which adds a TC filler to the PCM matrix, forms a phase change composite with high heat transfer performance that solves these pump-out issues.

Honeywell offers both pad and paste formats for its thermally conductive PCM. These products were designed to minimize thermal resistance at interfaces and maintain stable performance through the rigorous reliability testing required for long product life applications.

Based on a robust polymer PCM structure, this material exhibits effective wetting properties during typical operating temperature ranges, resulting in very low surface contact resistance. The proprietary material provides superior reliability and maintains low thermal impedance, making PCM desirable for high-performance integrated circuit devices.

Honeywell offers PCM in both pad and paste formats.

For almost 20 years, PCM products have been a Honeywell mainstay for thermal solutions in a wide variety of applications.

PCM paste is well-suited for the stencil printing application process.

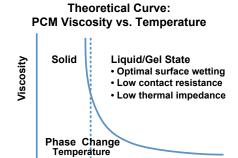

LTM6300, PCM45F, PTM5000, PTM6000, PTM6000HV, PTM7000, PTM7900, PTM7950

FEATURES

- High performance filler and polymer technolgy
- Phase change at 45°C
- Highly conductive filler loading to optimize performance
- Superior handling and reworkability
- Superior reliable thermal performance
- Range of thermal properties to fit different needs

PCM PERFORMANCE

Increasing Temperature —

Recommended Application

Clamping pressure and temperature are suggested to achieve a minimum bond line thickness, typically less than 1.5 mil (0.038mm) for best thermal performance.

Storage & Use

Shelf Life: 12 months at 23±2°C

Availability

PCM material is available in both sheet and roll formats. Stencil printable (SP) material is available in 300cc syringes or 1kg jars.

Thickness Range: 0.2mm–1.0mm (PTM7950 is only available in 0.25mm thickness)

Thickness Tolerance: ±0.075mm

THERMAL GAP PADS

Honeywell Thermal Gap Pads (TGPs) provide high thermal performance with ease of use for many applications. Ultra-high compressibility enables low stress and excellent conformity to mating surfaces. Honeywell TGP models are naturally tacky, and require no additional adhesive which could inhibit thermal performance.

Models: TGP1200, TGP1500, TGP3000, TGP5000, TGP6000, TGP8000

TYPICAL APPLICATIONS

- Consumer electronics
- Telecommunications & network servers
- Automotive electronics
- Power devices & modules
- Semiconductor logic & memory

Honeywell TGP model gap pads are available in standard sheets and also custom die-cut parts, and in a range of thicknesses.

The low oil-bleeding property protects components from contamination.

THERMALLY CONDUCTIVE, **HIGH COMPRESSIBILITY GAP PAD**

Honeywell TGP models provide thermal performance with ease of use across a multitude of applications. They have been designed to minimize thermal resistance at interfaces, and maintain effective performance through reliability testing. TGP models are silicone based, therefore they offer a certain anti-shock effect, with electrical isolation and non-flammability.

Honeywell TGP models are naturally tacky, and require no additional adhesive which could inhibit thermal performance. A range of thicknesses from 0.5mm to 5.0mm are available. Honeywell TGP models come with two surface liners, which enables users to remove the liner after installation (before operation), with no contaminant risk and easier handling.

FEATURES

- High thermal performance
- Ultra-high compressibility for low stress applications
- Excellent surface wetting for low contact resistance
- High reliability
- Electrically insulating

Storage & Use

Shelf Life: 12 months at 23±2°C

Thickness Range: 0.5-5.0mm with 0.25mm incremental

Thickness Tolerance:

- >1mm, ±10% 0.5-1mm, ±0.1mm
- <0.5mm, ±0.05mm

Please check thickness availability before ordering.

Low hardness provides excellent surface wetting and high compressibility.

Two surface liners enable easier handling with less contamination risk.

TGP8000HV / High Breakdown Voltage

THERMALLY CONDUCTIVE. **HIGH BREAKDOWN VOLTAGE GAP PAD**

TGP8000HV is a Thermal Gap Pad which offers a strong combination of low thermal impedance, high breakdown voltage and ease of use across a wide variety of applications. The naturally tacky property means there is no need for an additional adhesive, which could inhibit thermal performance. Available formats for TGP8000HV include standard sheets and custom die-cut parts in a range of thicknesses.

Applications & Features

In addition to the features of the TGP1200-TGP8000 line, TGP8000HV is effective for applications that require high breakdown voltage.

THERMAL PUTTY PADS

Honeywell Thermally Conductive Putty Pads provide high thermal performance and solid thermal reliability. The material's putty-like consistency enables excellent gap-filling capability for applications with large dimensional variances.

TYPICAL APPLICATIONS

- EV battery & charging station
- Automotive electronics
- Power devices & modules
- Telecommunications & network servers

TGP putty pad materials are ideal for applications with large dimensional variations between surfaces.

TGP3500PT, TGP6000PT, TGP8000PT

HIGH THERMAL CONDUCTIVITY, HIGH COMPRESSIBILITY, THERMAL PUTTY PAD

Special surface reinforcement enables easier handling for operators, with no pull-out during high-volume assembly. The product is naturally tacky and requires no additional adhesive to mate to the heat source and heat sink. Thermal putty pads are available in thicknesses ranging from 0.5mm to 5.0mm.

THERMAL INSULATORS

The TIP series is Honeywell's latest high-performance thermal conductivity and insulation material. It is made with silicon resin as the matrix, reinforced with glass fiber as the substrate.

TYPICAL APPLICATIONS

- Automotive electronics
- Power conversion equipment
- Power supply equipment
- Motor controllers
- Speaker amplifier
- Power switch

The TIP series provides low thermal impedance and high insulation for high power and high voltage applications.

Storage & Use Shelf Life: 12 months at 23±2°C

Configurations AvailableSheet form and die-cut parts

TIP1500, TIP3500

HIGH THERMAL CONDUCTIVITY, ELECTRICAL INSULATION

TIP1500 combines 1.5 W/m·K, and TIP3500 combines 3.5 W/m·K thermal conductivity, with superior insulation. TIP1500 and TIP3500 are designed to be soft and conformal, which provides excellent mating surfaces for low-pressure mounting. TIP1500 is offered in 0.19 and 0.23mm thickness. TIP3500 available thicknesses range from 0.25mm to 0.50mm.

FEATURES

- High thermal performance
- High breakdown voltage
- Good resistance to tears, cut-throughs and punctures
- Single side PSA available for easy assembly

Honeywell silicone grease products provide superior thermal performance with ease of use across a multitude of applications. The low viscosity and inherent thixotropy make the technology a good fit for large-scale production with dispensing, screen printing and stencil printing.

TYPICAL APPLICATIONS

- CPU, GPU and chipsets
- LED assemblies
- Automotive electronics
- IGBT & power units
- Flipchip BGAs

HIGH THERMAL CONDUCTIVITY THERMAL GREASE

Thermal Grease is a common silicone thermal interface material, usually used to increase thermal contact conductance across jointed solid surfaces. Thermal interface materials occupy the space of air (a very poor thermal conductor) and fill in the gaps between two solid surfaces. This establishes an effective thermal path between a heat-generating component and a heat sink attached to it, therefore greatly increasing thermal transfer efficiency.

Silicone thermal grease is a composite containing silicone and inorganic or metal nanomaterials with high thermal conductivity. Compared with thermal pads or liquid gap fillers, grease has the lower viscosity, and it can be used by dispense or screenprint, forming a thinner thermal conductivity layer with high thermal conductivity performance.

Honeywell thermal greases are designed to minimize thermal resistance at interfaces, and maintain excellent performance through reliability testing. TG series products are offered with varying thermal impedance and thermal conductivity properties to complement different power densities in real applications. Products are also available in a range of bondline thicknesses (BLT) to meet variations in interface flatness.

FEATURES

- Low viscosity and excellent thixotropy for dispensing or stencil/screen printing
- Range of BLT thicknesses
- Thermal resistance and thermal conductivity options for different power densities
- High stability and reliability
- Stable and homogeneous at room temperature storage

Storage & Use Shelf Life: 12 months at 23±2°C

Honeywell thermal grease remains stable under room temperature storage.

TG20001, TG28001, TG3000, TG30001, TG4000, TG5500

Low viscosity and excellent thixotropy make thermal grease appropriate for large-scale production.

THERMAL ONE-PART HYBRID

Thermal conductivity liquid gap fillers not only have the benefits of shape recovery, strong material cohesion, and good long-term thermal stability — they also offer a very low thermal resistance comparable to thermal grease, and can fill gaps at interfaces.

TYPICAL APPLICATIONS

- Consumer electronics
- Telecommunications equipment
- Automotive electronics
- Power supplies & semiconductors
- Memory & power modules
- Power electronics

One-part thermal Hybrid offer good dispensing and thixotropy properties for automated assembly processes.

ONE-PART, DISPENSABLE, VERY LOW COMPRESSION FORCE, THERMAL HYBRID

Hybrid is a substance between liquid and solid, combining the advantages of thermal grease and thermal gap pad, without the potential problems of either. Thermal Hybrid is prepared as a silicone polymer, with low molecular siloxane, and mixed with high thermal conductivity particles (such as alumina, aluminum nitride powder, etc.).

Compared with thermal grease, the main difference is that thermal Hybrid does not present oil separation issues while in storage, and the Hybrid can be torn off and reused. Thermal Hybrid only needs a relatively low working pressure when connected with heat sink and chip, and has a wide working temperature range.

The HT series, our one-part Gap Filler, provides effective thermal properties and high conformability along with its high compressibility. It is formulated to deliver high dispense rates for improved productivity, long-term reliability performance and easy re-workability. It is designed to minimize thermal resistance at interfaces, maintain its performance through reliability testing, and provide

FEATURES

- High thermal performance and low contact resistance
- Easily dispensable and reworkable
- High compressibility for low stress applications
- Long-term reliability
- No pump-out or cracking risk
- Reduced oil separation
- Requires no mixing, additional curing or low temperature storage

scalable application at a competitive cost. All HT series products are available in 280cc aluminum cartridge, and 1 and 5-gallon pail.

HT3500, HT5000, HT7000, HT10000

Availability

Syringes—200+200cc Jar—1+1gal, 5+5gal On request

TWO-PART, DISPENSABLE, VERY LOW COMPRESSION FORCE, THERMAL HYBRID

Prior to curing, the material maintains good thixotropic characteristics and low viscosity to be easily dispensed.

The product can be cured in a short time after two-component mixing at room temperature. The high compressibility minimizes thermal resistance at interfaces, while maintaining excellent performance during reliability testing.

Hybrid thermal interface materials offer a variety of options for dispensing methods, depending on the application.

FEATURES

- Low contact resistance
- Easily to dispense and rework
- High compressibility for low stress applications
- Long-term reliability
- Reduced oil separation
- No pump-out and cracking

State-of-the-art two-part Hybrid with high thermal conductivity for high power density applications.

Thermal Conductivity (W/m·K)	2.0	2.0	3.5	7.0	9.0	10.0	ASTM D5470	
Thermal Impedance (°C·in²/W) (1mm@10psi, typical value)	0.66	0.60	0.44	*	*	*	ASTM D5470	
Cure Schedule								
25°C (hour)	10	16	12	*	*	*	-	
100°C (minute)	30	30	30	*	*	*		

^{*}Contact Honeywell for latest information. ** Brookfield Viscometer, #7 spindle, 10rpm

The recommended modified viscosity and cure schedule meets large-scale application requirements.

DEVELOPMENT AND MANUFACTURING LOCATIONS

United States

Santa Clara, California Sunnyvale, California Spokane, Washington Chandler, Arizona Salt Lake City, Utah Bryan, Texas Mansfield, Texas Fombell, Pennsylvania

Europe

Seelze, Germany

Asia

Shanghai, China Jincheon, Korea Yaita, Japan Chonburi, Thailand

▲ Research & Development Site • Manufacturing Site

HONEYWELL ADVANTAGES

Quality

- Industry-leading reliability over device lifetime
- More than twenty years specializing in TIM materials R&D and manufacturing
- Proprietary formulations optimized for the needs of specific applications
- Proven, long-standing supplier with multiple worldwide quality certifications

Customer Focused

- Serving diverse range of customers
- TIMs offered in a wide range of thermal conductivity and application forms
- Superior global technical support
- Portfolio of other materials, such as thermal spreaders, electrical interconnect and pure metals
